(54) Abstract Title

Radiation applicator

(57) Radiation applicators comprise an elongate device having an antenna (240, 340) at their tip for coupling radiation into biological tissue and a dielectric body (250, 350) surrounding the antenna so as to encompass substantially the whole of the near-field region of the antenna and/or to enhance transmission of radiation in the forward direction. The body (250, 350) may be cylindrical with the antenna (240, 340) along its axis. The antenna may be  $\lambda/2$  in length and  $\lambda/2$  in radius. The tip (270) of the antenna (240) may be rounded hemispherical with radius  $\lambda/2$  to enhance forward transmission of radiation. The dielectric constant ( $\epsilon$ ) of the body (250, 350) is as high as possible to reduce its diameter at a desired operating frequency but may be matched to the surrounding tissue by another layer of dielectric material (380) with a value ( $\epsilon$ ) intermediate that of the core (360) of the body (350) and the tissue.
